One Stop Solutions

Optimizing retention, drainage, and formation is a balancing act for papermakers. Each of these variables is equally important: improved drainage can speed up the machine, resulting in increased production. It can also allow for more water to be added to the headbox to help generate better formation. Improved retention can lead to lower wet-end chemical use, lower sewer losses, and improved strength. And formation is directly related to sheet integrity, strength, and overall aesthetics. However, standard retention aid polymers are “anti-formation” aids, and standard silica products can help drainage but do very little for retention. It’s an ongoing challenge to optimize all three variables without sacrificing at least one.

To overcome these challenges, Maven Solutions has introduced **REDRAN^{MAX}**- advanced retention and drainage solutions. A revolutionary combination of technologies that dramatically widens the paper-making operating window, enabling kraft, writing-printing and specialty paper producers to optimize Retention and Drainage but most importantly, stay competitive through increased productivity and superior product offerings.

Science Meets Practicality

Maven Solutions, with years of research have developed a composition of chemical technologies which redefines the optimization of paper production. Our chemistry do not only serves the desired purpose but ensures multiple aligned benefits which makes the process - Cleaner and Healthier.

REDRAN^{MAX} first in class mechanism of dispersing down the Fibre/Colloidal/Nano Particles, fixing them together and carrying it forward into the final product, helps in controlling Excessive Fines/Fines Filler Complex/Colloidal in the process water. This do not restrain to one cycle but it keeps getting better in every cycle. All the components are modified in such a way that the on field execution of the program is easy, convenient and cost/time saving.

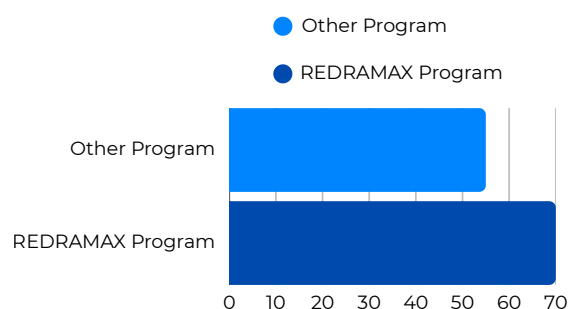

The Complete **REDRAMAX** Program

With **REDRAMAX**, the papermaker now have a total solution for superior retention, drainage and formation. The end result is a controllable program with a linear dosage response that offers papermakers an improved operating window with ultimate flexibility. The table below describes the best practices of a **REDRAMAX** program -

COMPONENT	DOSING POINT	DOSAGE (KG/TON)	DESCRIPTION
MS - NEROCOL C	Post Screen	0.5 - 1	Specially modified products which exceeds the results of industry standards.
MS - BENPRO	Post Screen	1 - 3	Flexibility to use MS - NEROCOL C individually or together with MS - BENPRO for optimal performance. Depends on customer needs and manufacturing process.
PAC/ALUM (Polyaluminum Chloride)	Thin Stock	2 - 3	May or may not be needed; if necessary, typically use mill alum.
Cationic or Anionic Polyacrylamide	Post Screen	0.1 - 0.2	Maven Solutions provides wide range of Cationic or Anionic Polyacrylamide with varying molecular weight and charges. After lab evaluation and system charge analysis, we choose the best for your system.

Optimal program for each machine is determined by lab testing. Maven Solutions has no limitations on how **REDRAMAX** can be applied.

Superior Results

When compared to the regular retention program, **REDRAMAX** offers a minimum of 10% better results with a better cost efficiency.

Other allied benefits that the program offer -
 Better process water quality,
 Lesser load on ETP,
 Maintain Solvency Capabilities of Process Water,
 Less Sludge Generation
 Reduce/Eliminate Bad Odour from the System
 and more.

Performance Oriented

With Maven's performance oriented approach, we work together with our clients as a team to obtain an ideal balance between chemistry and performance.

Our expertise solutions allow us to correctly identify and understand your specific need in designing perfect solutions. Before beginning to discuss what system and solutions will best meet you need, our highly trained expert technical support personnel starts with on field evaluation of the plant, learn about the particulars about your situation and after various lab evaluation will propose a combination best suited for your system.

More Information

For technical advice and insights on how the **REDRAMAX** technology can help you build your competitive edge, talk to a **MAVEN** expert today.

Chemistry Simplified.

We believe that working together as a team is most important for any two organisations. Partnering with Maven ensure - Dedicated and transparent working approach. Today the trend is of creating long term partnerships that add value to the knowledge and business is base of any growing organisation.

With Chemical Technologies which are Exclusive, Solution Oriented and Cost Effective - we are constantly expanding our boundaries to establish our organization into various countries across continents.

Towards A Better Future.

The listed technical values and product specifications are indicative and relied on tests performed under laboratory conditions, using distilled water. Mixing water quality and purity also significantly affects the solutions properties and performance. The information above does not release customers from any obligation to perform their own tests and it is recommended that any decisions regarding the use of our products is based on the results of such tests.

Towards A Better Future.
